PORCELAIN

PORCELAIN

Porcelain is a type of ceramic produced by mixing natural minerals such as clay, feldspar and quartz and firing them at high temperatures. Due to its fine structure, durability and aesthetic appearance, it is used in many different areas, especially tableware, decorative items, sculptures and medical equipment. The characteristic feature of porcelain is that it has a transparent and hard structure when fired at high temperatures. In the production of porcelain, a special clay containing a high percentage of aluminum oxide, called "white porcelain" (kaolin), is generally used. This helps the porcelain to be white in color and also durable
